NCR PAPER Brand Specialties

For special applications including heavyweight, lightweight, self-contained, Spot Safe CB, etc.

How NCR PAPER* Brand Carbonless Works?

- The carbonless system consists of liquid dye and oil-filled microcapsules dispersed within a solid coating.
- In a typical three-part business form, three kinds of carbonless paper work together as a system to transfer images cleanly and clearly from one sheet to the next.
- The top sheet is a CB (coated back) sheet, the back of which is covered with a coating made of millions of microscopic capsules containing colorless dyes.
- The last sheet is a CF (coated front) sheet, coated on its front side with a coreactant or receiver material.
- The middle sheet is a CFB (coated front and back) sheet, front-coated with receiver materials and back-coated with dye capsules.
- As pressure from a pen is applied to the top sheet, the dye capsules on the CB surface break and interact with the CF receiver coating to develop a black or blue image on each copy.

Basic System

Coated Back (CB)
Coated Front & Back (CFB)
Coated Front (CF)
